

DETERMINE PATIENT PROPENSITY TO PAY

PokitDok's Payment Risk solution enables lending institutions, payment solutions, health systems, and medical practitioners to calculate the financial risk of healthcare transactions and to make new financing options available to patients for non-acute medical services. Our Payment Risk algorithm combines public, customer, and proprietary data to estimate the likelihood that a patient will pay their bill and calculate the probability that a provider will be reimbursed by a payer for a specific amount.

Easy to Integrate

Use PokitDok Payment Risk solution as an API endpoint.

Benefits

Unique Blend of Data Sources:

Only PokitDok blends customer and proprietary data with national healthcare specific payment and loan data, demographics, health markers, and consumer financial attributes to calculate the financial risk associated with a specific patient.

Broadest Coverage of Healthcare Data:

PokitDok combines CPT code, provider procedure experience, average reimbursement rate, clearinghouse data and other measures to calculate the likelihood that a provider will be reimbursed a given amount by a payer.

Real-Time Insight:

Our algorithm is designed to calculate the financial risk of healthcare transactions in real-time. Which means that you can now understand the likelihood of being reimbursed when it matters most, before a healthcare encounter begins.

Platform Advantage:

We are secure, scalable, compliant, and built to support your growth. PokitDok is HITRUST certified and is the first healthcare software company to be accredited with CAQH® CORE® PHASE IV certification.
