

CONNECT PATIENT RECORDS ACROSS HEALTH SYSTEMS

PokitDok's Identity Management solution identifies, maps, and matches disparate data so that healthcare applications have access to more accurate information concerning patient identity.

Easy to Integrate

Use PokitDok Identity Management as API endpoints.

Benefits

Blockchain-Ready

All of our APIs are smart contract enabled. DokChain, our healthcare blockchain technology, is architected to provide contextually relevant, multi-party identity, validation, verification, authentication, and authorization.

Connect Patient Records

Unify patient records across multiple health systems and disconnected EHRs to improve care coordination. Our Identity Management API queries an Enterprise Master Patient Index to find record identifiers and details in target systems.

Field Tested

PokitDok's identity management technology has been validated through proof of value tests with numerous large healthcare institutions.

Authenticate Patient Access

Authenticate and authorize patient access to other applications and information such as benefits coverage, patient records, or claims information.

Scalable Platform

The PokitDok platform is secure, scalable, compliant, and built to support your growth.

Easy to Integrate

Interoperability is core to the PokitDok platform so you can quickly and easily integrate with third party data sources.
